

Hospital Management System

Manual Testing – Test Plan

This test plan defines the approach, scope, test activities, resources, and exit criteria for manual testing of the Hospital Management System (HMS).

1. Project Overview

The Hospital Management System is tested to verify core healthcare workflow functionality, data validation, navigation, user-interface behavior, and role-based workflows. Testing is performed from a functional and end-user perspective.

2. Test Objectives

- Verify that application functions work according to expected requirements.
- Validate input fields, mandatory fields, boundary/negative conditions, and error messages.
- Verify navigation, buttons, filters, search, refresh, downloads, print/preview and other user actions.
- Identify, document, and track defects with appropriate severity and priority.
- Perform retesting of fixed defects and regression testing of impacted functionality.

3. Modules in the Test Workbook

Module	Workbook Coverage
Login	Included in test execution workbook
Patient Dashboard	Included in test execution workbook
Receptionist	Included in test execution workbook
Nurse	Included in test execution workbook
Doctor	Included in test execution workbook
Lab Tech	Included in test execution workbook
Pharmacy	Included in test execution workbook
Billing	Included in test execution workbook
Admin	Included in test execution workbook
Report	Included in test execution workbook

4. Scope of Testing

- Functional testing of user workflows and business functions.
- UI testing including alignment, sizing, labels, visibility and usability-related observations.
- Validation testing for valid, invalid, blank and boundary input conditions.
- Smoke testing of major application flows after a build/deployment.
- Regression testing after defect fixes or relevant application changes.
- Retesting of failed test cases after fixes.

5. Out of Scope

- Production data validation unless explicitly authorized.
- Performance/load testing unless a separate performance scope is defined.
- Security/VAPT testing beyond explicitly authorized security activities.
- Source-code review and database-level validation unless separately requested.

6. Test Types

Testing Type	Purpose
Functional Testing	Verify application functions and workflows.
Smoke Testing	Confirm critical flows are stable for further testing.
Regression Testing	Check existing functionality after changes/fixes.
Retesting	Verify that reported defects have been fixed.
UI Testing	Verify layout, controls, text, alignment and visual behavior.
Positive Testing	Verify valid inputs and expected successful flows.
Negative Testing	Verify invalid inputs and error handling.

7. Test Deliverables

- Manual test scenarios and test cases.
- Test execution results with Pass/Fail status.
- Bug/defect report with severity and priority.
- Screenshots or evidence for relevant defects.
- Retest and regression results.
- Final test summary report.

8. Defect Management

Each defect should contain a clear title/description, module, reproducible steps, expected result, actual result, severity, priority, status and supporting evidence where applicable. Fixed defects should be retested and their retest status recorded.

9. Entry Criteria

- Testable application build/environment is available.
- Required user roles and test accounts are available.
- Basic functional requirements or expected behavior are known.
- Test data is available where required.

10. Exit Criteria

- Planned test cases have been executed or their status is documented.
- Critical testing flows have been covered.
- Defects are logged and tracked with appropriate status.
- Retesting/regression testing is completed for applicable fixes.
- Final test results and known limitations are documented.

11. Risks and Mitigation

Risk	Mitigation
Environment instability	Record blocked cases and retest when environment is stable.
Requirement ambiguity	Confirm expected behavior before marking a case.
Incomplete test data	Prepare representative positive and negative test data.
Defect fix impacts other modules	Run focused regression after fixes.

12. Test Environment / Tools

- Application: Hospital Management System
- Test approach: Manual testing
- Test management/evidence: Microsoft Excel and screenshots
- API testing (where applicable): Postman
- Browser/UI support: Chrome DevTools
- Mobile/security testing (where applicable): ADB and MobSF

13. Approval / Sign-off

Role	Name	Date	Signature
QA / Tester
